MIRRORZz

Unlike other reverse delays, the TRIGGER function of MIRRORZ allows you to play backward the last chords/ melody you JUST played (not delayed), same for the LOOP function but looped.

Audio IN is permanently recorded in a 150 seconds buffer.

How it works:

Pressing TRIGGER (momentary ON) start reading audio backward from the last sampled position within the data/buffer, releasing TRIGGER stop reading audio.

Pressing LOOP (momentary ON) reads audio backward from the last sampled position within the data/buffer, releasing "LOOP" loop the buffer segment just read. Pressing TRIGGER stop the loop (if you keep TRIGGER pressed, it reads audio backward from the last sampled position within the data/buffer)

Parameters

DRY/WET obvious

FILTER 0 → -100 Low pass , 0 → 100 High pass

SPEED 0.5 = half speed, 1 octave down
1= normal speed
2= double speed, 1 octave up

(Info : Playing a sound file at 2x speed does not inherently increase its volume, but audio may perceive as louder or more intense . And of course the opposite for half-speed.)

RANDSPDON Random speed On, override the SPEED selector to apply speed randomly

RANDSPEED How quick the Random speed change

ENV envelope applied to the looped sound to avoid clicks.
